List of functions not working correctly:

We only had one user story that we couldn't implement. This was the voice report function that we were trying to integrate in sprint 4. It was split up into two tasks so we lost a total of 4 story points.

Input: Tried to implement the google voice API.

Action: Tried to invoke a certain command when you ask: "Okay Google report sighting".

Location of fault: After further research on the google voice API we realized that there are third party limitations.

Possible action for removal of fault: A possible action we could take to remove this fault would be to wait for the google voice developers to implement third party features. This would be outside the scope of this project so it would essentially be impossible for us to finish this by sprint 4.
